

Annual Management Discussion & Analysis¹
for
CARIBOO ROSE RESOURCES LTD.

Containing information up to and including June 28, 2024

Description of Business

Cariboo Rose Resources Ltd. (the “Company” or “Cariboo Rose”) is an exploration stage company engaged in the acquisition and exploration of prospective copper, gold and molybdenum properties in Western Canada. The Company trades as a Tier Two company on the TSX Venture Exchange (“Exchange”) under the symbol “CRB”. The Company’s head office is located at Suite 110 – 325 Howe Street, Vancouver, BC.

OVERALL PERFORMANCE

Summary:

- In April 2024 Vizsla Copper terminated its option on the Carruthers Pass Property
- In March 2024 the Company was advised by Basin Uranium that reverse circulation drilling had begun on its Carbonate Hosted Gold Project.
- In February 2024 the Company released the results of five reconnaissance drill holes completed on the Cowtrail copper-gold property.
- In May 2023 the Company was advised by optionee BRS that a crew and equipment had been mobilized to the property in preparation for diamond drilling in early June, 2023.

SELECTED ANNUAL INFORMATION

The following table summarizes selected financial data for Cariboo Rose for years ended February 29, 2024, February 28, 2023, and February 28, 2022. This information should be read in conjunction with the audited financial statements, prepared in accordance with IFRS, and related notes.

	2024	2023	2022
Total revenue	\$ Nil	\$ Nil	\$ Nil
Loss for the year	302,559	297,253	292,005
Basic and diluted loss per share	0.01	0.00	0.01
Comprehensive loss	336,341	299,724	294,743
Total assets	1,699,049	2,034,678	2,331,582
Total liabilities	162,728	194,433	191,613
Cash dividends per share	Nil	Nil	Nil
Number of shares issued and outstanding	47,461,888	47,461,888	47,461,888

Loss is expected to fluctuate from year-to-year primarily due to the activity level of the Company’s exploration projects, the strength of equity markets and the Company’s ability to finance on favorable terms.

¹ Note to Reader

This Annual Management Discussion and Analysis (“Annual MD&A”) should be read in conjunction with the Company’s audited financial statements for the year ended February 29, 2024.

Forward-Looking Information

When used in this document, words like "anticipate", "believe", "estimate" and "expect" and similar expressions are intended to identify forward-looking statements. Such statements are used to describe management’s future plans, objects and goals for the Company, and therefore, involve inherent risks and uncertainties. The reader is cautioned that actual results, performance, or achievements may be materially different from those implied or expressed in such statements.

Currency - Unless otherwise stated, all currency amounts are stated in Canadian dollars.

RESULTS OF OPERATIONS

Year Ended February 29, 2024

The Company's loss of \$302,559 for the year ended February 29, 2024 ("Current Period") was similar to the loss for the year ended February 28, 2023 ("Comparative Period") of \$297,253. Significant differences between the Current Period and the Comparative Period include share based compensation, a non-cash expense resulting from the issuance of share purchase options to Directors and senior management (Current period - \$32,417; Comparative Period - \$nil), professional fees (Current period - \$60,014; Comparative Period - \$25,119) and a provision for BCMETC accounts receivable Current period - \$nil; Comparative Period - \$109,958).

Expenditures on exploration properties represented the greatest use of funds for the Current Period (Current Period - \$102,464; Comparative Period - \$412,987).

Three Months Ended February 29, 2024

The Company's net loss for the three months ended February 29, 2024 ("Current Quarter") of \$133,311 was less than the net loss for the three months ending February 28, 2023 (the "Comparative Quarter") of \$207,646. As mentioned earlier in this Annual MD&A, results were largely influenced by a provision for BCMETC accounts receivable recorded in the Comparative Period of \$109,958 (Current Period - \$nil).

Exploration Expenditures

Acquisition and exploration expenditures incurred on mineral properties for the year ended February 29, 2024 and February 28, 2023 are:

	2024	2023
ACQUISITION COSTS		
Incurred during year	\$ 2,101	\$ 2,635
EXPLORATION EXPENDITURES		
Assaying	3,021	59,435
Communications	1,490	1,163
Drilling	-	216,380
Field Equipment	28	2,866
Food and accommodations	2,430	4,864
Freight	-	1,690
Geological	270	2,608
Other	429	4,059
Professional fees and field crews	89,472	103,238
Rental of vehicles and equipment	1,808	5,765
Road building	-	6,418
Transportation and fuel	1,415	1,866
	<u>\$ 100,363</u>	<u>\$ 410,352</u>
OTHER ADJUSTMENTS		
Property option proceeds	\$ -	\$ (113,559)
Mineral Tax Credit	(109,989)	-
Write-off of exploration and evaluation assets	-	29,648
	<u>\$ (7,525)</u>	<u>\$ 83,911</u>
Net (Decrease) Increase in Exploration and Evaluation Assets		

MINERAL PROPERTIES

Carruthers Pass Property, Omineca Mining Division, British Columbia

The Carruthers Pass Project (3,895 hectares) is a massive sulfide project (VMS), base and precious metal project, located in Northern BC approximately 30 km west of the Kemess Mine Road. Carruthers Pass was discovered in 1997 by Phelps Dodge Corporation (now Freeport McMoran Inc.) during evaluation of a copper-zinc-cobalt stream sediment anomaly then identified and published by the BC Ministry of Energy Mines and Petroleum Resources. In 2003 Cariboo Rose (then Wildrose Resources

Ltd. – hereafter Cariboo Rose) optioned Carruthers Pass from Phelps Dodge and in 2011 earned a 100% interest in it (subject to a 2.5% net smelter royalty interest, which may be reduced to 1% with a cash payment by the Company of \$1,500,000). Carruthers Pass has two points of intrigue: Firstly a very large slab of massive sulfide mineralized rock protruding from talus that when drilled returned an intercept of 3.1 metres grading 6.2% copper, 5.8% zinc, 2.37 g/t gold and 192.0 g/t silver; Secondly, previous to the option with Cariboo Rose, Freeport had completed extensive first pass soil sampling and provided a data base with nearly 1,000 samples. Within this data are long sequences of soil samples with copper and zinc values in the thousands of parts per million and cobalt values in the hundreds of parts per million. The soil data base has seen virtually no follow-up and the probability of finding significant bedrock mineralization responsible for these soil results is excellent. In 2004 Cariboo Rose completed a 295 line kilometer (helicopter borne) electromagnetic survey. Six hundred and twenty seven (627) conductors were identified of which 454 were interpreted to have a discrete bedrock origin. Very little follow up of this data has yet been completed.

In February 2018 the Company reported that re-evaluation of rock and soil samples at the Carruthers Pass Project has identified significant concentrations in cobalt heretofore overlooked.

Surveys completed by Phelps Dodge in 1997 to 2000 located two areas of massive sulfide mineralization 4 kilometers distant from each other and an extensive area of highly anomalous soils exceedingly anomalous in copper, zinc, silver and cobalt in between. The soil anomaly, defined by a 935 soil sample survey, is northwest trending and approximately 6 kilometers by 1.5 kilometers in extent at a 300 ppm copper threshold (8 samples exceed 1,000 ppm Cu) within which is a coincident soil zinc anomaly measuring approximately 4 km by 0.5 km at a 650 ppm zinc threshold (with values reaching 4,580 ppm Zn). Within the copper-zinc anomaly soil cobalt values routinely exceed 100 ppm and occasionally exceed 250 ppm. Little or no follow up of the cobalt anomalies has occurred and there is no record of any exploration in the area of the Carruthers claims prior to Phelps Dodge.

The western massive sulfide prospect is described in a 1997 Phelps Dodge Report is a 20 meter by 20 meter exposure of pyrrhotite-chalcopyrite dominant massive sulfide in shale. It returned an analysis of 0.83% copper, 51.46% iron and 687 ppm cobalt but is not believed to have been revisited since. A second area of massive sulfide occurring 4 kilometers to the east subsequently became the focus of exploration at Carruthers Pass. At this eastern site stratabound massive sulfide was discovered as a large slab protruding from talus and later in nearby cliff faces. The slab was drilled by Cariboo Rose (and then partner, La Quinta Resources Corporation) in 2011, returning a 3.2 meter intercept grading 6.24% copper, 5.87% zinc, 2.37 g/t gold and 192.0 g/t silver (but without significant cobalt). Interest in the area that includes the massive sulfide slab has dominated exploration efforts at Carruthers Pass and is responsible for the limited follow up of the cobalt soil anomaly and the western massive sulfide occurrence which includes cobalt.

In March 2021 and amended November 18, 2021, the Company entered into an option agreement with Vizsla Copper Corp. that grants Vizsla Copper the right to earn a 60% interest in the Carruthers Pass copper-zinc-silver-gold and cobalt property located in Northern British Columbia approximately 75 kilometers southeast of the former-producing Kemess copper gold mine owned by Centerra Gold. Vizsla Copper is a proposed spinout from Vizsla Resources Corp. which has recently changed its name to Vizsla Silver Corp. To complete the option, Vizsla Copper is required to complete \$3 million in exploration and make \$650,000 in option payments over a five-year term.

In January 2023 Vizsla provided the Company an update on exploration activities completed in 2022 which included a helicopter supported drilling program was completed in the late summer and a total of 1,345m was drilled in three drill holes (CP22-15, 16B and 17), plus one abandoned drill hole (CP22-16). All of the drill holes are located in the Boulder zone and evaluated new potential sources for the namesake high-grade, massive sulphide boulder located there. The results from the drill program are encouraging and of particular interest is the discovery of massive sulphide layers in drill hole CP22-17, within a strong helicopter borne Versatile Time Domain Electromagnetic (VTEM) conductor. The massive sulphide layers are composed dominantly of pyrite and/or pyrrhotite, and may represent distal facies of a base metal rich VMS deposit. Geochemical analyses from drill core samples have been received. Highlights include 2,150 ppm Cu over 1.0m from 439.5m and 2,227 ppm Zn over 2.2m from 549.5m in drill hole CP22-16B. Approximately \$2.0 million was expended in the 2022 field program.

Significant to Carruthers Pass is a mineralized slab of rock weighing several hundred tonnes protruding from talus with a drill intercept through it of 3.1 meters grading 6.2% copper, 5.8% zinc, 2.37 g/t gold and 192.0 g/t silver. The geological environment here is interpreted to be permissive for sediment hosted (Besshi style) massive sulphide mineralization.

Recent Activity

In April 2024 Vizsla Copper terminated its option on the Carruthers Pass Property

Cowtrail Property, Cariboo Mining Division, British Columbia

The Cowtrail project is located near the community of Horsefly in the Cariboo region in central British Columbia. The property encompasses 4,797 hectares is accessible by highway and logging roads year-round with ample power and water supply nearby.

The Cowtrail property is underlain by rocks consisting of Upper Triassic to Lower Jurassic alkalic volcanics and intrusives. The area is relatively flat and outcrops are infrequent. Previous work on the project identified a large induced polarization / magnetic and soil geochemical target and completed 14 drill holes totaling 4,747 meters. Highlights of the drilling include hole 2007-001 which returned 18.2 meters grading 1.16 g/t gold and hole 2011-012 which returned 40.0 meters grading 0.17% copper and 0.11 g/t gold. Soil grids were expanded in 2021 with 813 new soil samples. A further 153 samples were collected in 2022.

In May 2022 the Company entered into an option agreement with BRS Mining Resources Ltd. that grants BRS the right to earn a 60% interest in the Cowtrail property. To complete the option, BRS is required to complete \$2 million in exploration and make \$400,000 in cash and share equivalent option payments over a four-year term.

Recent Activity

In February 2024 the Company released the results of five reconnaissance drill holes completed on the Cowtrail copper-gold property.

A five-hole drill program was conducted in 2023 on sites prepared in June, 2023 targeting areas internally called the Lea Lake and BM Breccia Areas with the most significant result being hole CT23-16 in the Lea Lake Area returning 0.15% copper over 105.0 meters, including 0.23% copper and 0.1g/t gold over 15 meters. Hole CT23-16 is collared 45 meters south of hole CT11-12 which previously returned 0.17% copper and 0.11 g/t gold over 40.0m. Mineralization intersected in hole CT23-16, occurring in diorite-andesite, remains open to the south.

In the BM Breccia Area, a further 1,500 meters to the west, hole CT23-18 intersected 0.82g/t gold over 6.0 meters. Hole CT23-19, also located in BM Breccia Area was abandoned in difficult drilling conditions at 47.6 meters with the final sample grading 0.11% copper.

The area to the south along the trend of the mineralization identified in drill holes CT-11-12 and CT23-16 is referenced in an unpublished internal Cogema Canada report from 1991 "a strong total magnetic field anomaly occurs 900 meters southwest of Jim Lowry Lake. This area is flat and completely till covered. Several pieces of proximal float consisting of mineralized biotite diorite and monzodiorite occur in this area". This area, plus or minus 1,500 meters south of hole CT23-16 is well within the property and has seen no recent work and no drilling.

Koster Dam Project, Cariboo Mining Division, British Columbia

The Koster Dam project, 100% owned by the Company, consists of ten mineral claims (4,535 acres) located approximately 80 km south of Williams Lake in south-central British Columbia. It is a reconnaissance gold exploration initiative targeting gold-silver mineralization similar to what occurs at the formerly producing Blackdome mine located approximately 3 kilometers to the south.

At Koster Dam, exploration initiated in 2012 and continuing in 2013, 2014, 2015, 2017 and 2018 was predominantly conventional silt sampling augmented with the preconcentrating of those samples in a portable sluice box. This work defined a well-focused anomalous target area. Conventional silt samples in the target area reach 632 ppb gold while samples preconcentrated in a portable sluice box reach 1,451 ppb gold. The next phase of exploration will develop procedures to identify the source of these anomalous gold results in an area that is devoid of outcrop.

In July 2017 the Company granted an option on the Koster Dam project to Ameriwest Lithium Inc. ("Ameriwest"), (formally Oakley Ventures Inc.). Ameriwest earned an initial 45% interest in Koster Dam.

In October 2020 Ameriwest exercised their option to acquire a 45% interest in the Koster Dam project upon completion of certain required qualifying expenditures pursuant to a restated and amended option and joint venture agreement dated October 26, 2018. In 2022 Ameriwest Lithium transferred its interest in the Koster Dam Project to ISM Resources Corp. ("ISM") and the Company and ISM entered into a joint venture agreement. ISM subsequently changed its name to Discovery Lithium Corporation.

2021 Exploration

In May 2021 the Company and joint venture partner Ameriwest commissioned an airborne geophysical survey on the Koster Dam project located approximately 10 kilometres north of the former-producing Blackdome gold-silver mine. The magnetic

survey employed a triaxial array, which allows for precise horizontal gradient measurements, which have become important because they provide details about the lateral extent of subsurface anomalies located between the survey lines (the vertical gradients). These gradients can assist in identifying geological/structural contacts and near-surface targets, which may host gold and silver mineralization.

The lidar survey collected elevation and positioning data by rapidly scanning the area with millions of laser-point measurements. The resulting product essentially strips vegetation from the image, greatly enhancing topographic features, which may include important linear mineralizing structures and which can subsequently be followed up on the ground.

Preliminary review of the Triaxial magnetic and liDar survey indicates a number of linear features in the general vicinity of anomalous rubble, soil and silt results (gold, silver and arsenic). The project is fully permitted for drilling. Tripoint Geoservices of Kelowna has been retained to complete additional geochemical surveying and prospecting vectoring in from existing anomalous clusters (gold) and linear features indicated in the 2021 airborne survey. The project is fully permitted for drilling. Tripoint Geoservices of Kelowna has been retained to complete additional geochemical surveying and prospecting vectoring in from existing anomalous clusters (gold) and linear features indicated in the 2021 airborne survey.

Gold mineralization was discovered at the Koster Dam project as a result of systematic prospecting. The current program was designed to target vectors originating from reconnaissance work completed in 2022 and high resolution airborne magnetic surveying completed in 2021. Four samples of float, predominantly subangular and consisting of quartz vein and quartz breccia hosted in rhyolite, returned gold analysis of 2.61, 2.38, 1.47 and 0.74 gram per tonne gold respectively (from a total of 58 samples collected with many of them heavily altered and flooded with chalcedonic quartz).

CHG (Carbonate Hosted Gold), Clinton Mining Division, British Columbia

The Carbonate Hosted Gold Project (CHG) is located in southern BC near the community of Clinton. It consists of 7 claims covering 4,194 hectares.

The primary target for the project is carbonate hosted gold (CHG) modeled on a number of gold deposits including Carlin Nevada, the high-grade Muddy Lake deposit located in northern BC and the recent discoveries in the Yukon Territory. The first claims for the Carbonate Hosted Gold Project were staked in 2012 to cover prospective source areas for high gold values in heavy mineral samples collected in 1986 and corroborative BCGS stream sediment anomalies which validated historic Geological Survey of Canada references from the 1890s describing float samples (“jasperoid”) with high-grade gold contents. Exploration programs subsequently completed in 2013, 2014, 2015 and 2016 have delineated localized strong stream sediment gold anomalies.

The Project was initiated by Cariboo in 2013 to explore for carbonate hosted gold in south-central British Columbia, such as occurs in Carlin, Nevada, Muddy Lake, British Columbia (Wheaton River Minerals-now Goldcorp), and at the Rackla gold project in the Yukon Territory (Atac Resources Ltd.). The claims overlie a sequence of Paleozoic and Mesozoic aged carbonate rocks located near the community of Clinton, BC. Rationale for the Project includes historical Geologic Survey of Canada reference to high-grade gold values being obtained in jasperoid float samples in the area (silicified carbonate).

Beginning in 2013, Cariboo began a program of silt sampling east trending water courses in the Marble Range. Significant gold anomalies were obtained in three drainages trending eastward and spanning a north-south distance of approximately three kilometers. All of the stream anomalies abruptly cut-off on their western (upslope) edge indicating a discrete source. Since 2013, Cariboo has collected and analyzed a total of 324 stream sediment samples, 895 soil samples and 132 rock (float or rubble) samples.

Option Agreement

In March 2020 and amended November 9, 2022, the Company announced the signing of an option agreement with Basin Uranium Corp. (formally Black Shield Metals Corp.) to advance its Carbonate Hosted Gold Project. Terms of the agreement will allow Black Shield to earn a 60% interest in the Project by completing \$1,500,000 in exploration, issuing 100,000 common shares and making \$285,000 in payments over a 5 1/2-year term. Following earning a 60% interest, Black Shield may earn an additional 10% interest (70% total) by paying Cariboo an additional \$500,000 and completing a feasibility study within a further 24 months.

2021 Exploration

In September 2021 the Company announced that project option partner Basin Uranium completed flying an airborne geophysical survey on the CHG project. Three 335 line kilometers (335) of helicopter borne survey were flown using the VTEM™ Time Domain EM system which has proven to be effective for locating discrete conductive anomalies as well as mapping lateral and vertical variations in resistivity (to identify contacts and faults which are potential fluid pathways).

Recent Activity

In March 2024 the Company was advised by Basin Uranium that reverse circulation drilling had begun.

Pat Claims, Cariboo Mining Division, British Columbia

The Pat Mineral Project, encompassing 1,087 hectares, is owned 100% by the Company, is located in southcentral BC approximately 15 km to the east of the village of Horsefly in the Cariboo Mining Division. It is a copper-gold porphyry target centered on a regionally significant aeromagnetic anomaly. Originally staked by Cariboo Rose in 2004, the property is contiguous with the Woodjam copper-gold porphyry project owned by Consolidated Woodjam Copper (now Vizsla Copper Corp.) covers a very strong unexplained magnetic airborne anomaly in prospective Nicola Group volcanic rocks. Vizsla Copper Corp. has a first right of refusal on the property.

In January 2023, the Company entered into an agreement with Vizsla Copper Corp. that grants Vizsla Copper Corp. the right of first refusal to earn a 60% interest in the Pat Claims or the right to earn it by completing \$2,000,000 in exploration, making cash payments of \$200,000 and making additional cash or share payments totaling \$200,000 over a four-year term.

Coquigold Project, Nicola Mining Division, British Columbia

In response to the recent success being achieved at the Shovelnose gold project owned and operated by Westhaven Ventures Inc., the Company staked three claim blocks, subsequently consolidated into one block referred to as the Coquigold Project, covering 2,661 hectares adjacent to the Coquihalla Highway.

Red Vein Target ("D Zone")

The Red Vein claims cover an area (the D Zone) where a sample of silica altered volcanic? was sampled in 2008 by the British Columbia Geological Survey and published in paper 2008-8. The sample was a composite chip from outcrop and subcrop over an area with a width of approximately 20 meters (before disappearing under overburden). It is described as a red oxidized silica altered volcanic containing minor bladed barite in a siliceous gangue. The sample returned 2,423 ppb silver (2.4 g/t), 173 ppm arsenic, 4,250 ppb mercury, 23 ppm antimony, 794 ppm lead, 623 ppm copper and <0.2 ppb gold.

Subsequent collection and analysis of several samples in 2019 by Cariboo Rose from the alteration zone included silver values to 43.1 ppm (43.1 g/t), arsenic to 559 ppm, mercury to 13.4 ppm (13,400 ppb), antimony to 101 ppm, lead to 2,593 ppm, copper to 933 ppm and gold to 2.0 ppb. Host rocks are interpreted to be dominantly brecciated quartz diorite with a possible minor component of volcanic rock. Alteration consists of pervasive chalcedonic quartz flooding, limonite/hematite/pyrite gossan on fractures with occasional malachite. The zone is attenuated in a north south direction and extends to the northern boundary of the claim (its continuation further northward is unknown). The present dimension of D Zone is approximately 40 meters by 100 meters with the zone disappearing beneath overburden to the west and northeast. Local limonite alteration zones in the quartz diorite occur on this same trend for 1,200 meters south to the claim boundary suggesting a fault along this trend.

No evidence has been found of any additional sampling of this occurrence since its discovery in 2008 and staking by Cariboo Rose in 2018.

A second zone of alteration discovered and described by the BC Geological Survey in 2008 occurs 2.8 kilometers to the northwest of D Zone. This Zone, called the XYZ Zone is an area of bedded siliceous rocks (sinter) located within outcrops of porphyritic basalt rocks. An old trench and pit are located nearby (no MINFILE reference exists). Grab samples from the old workings returned anomalous values; copper to 792 ppm, zinc to 815 ppm, arsenic to 334 ppm and gold to 30.8 ppb.

Sinter Target

The Sinter claims cover a silica sinter and exhalite occurrence discovered and described by the British Columbia Geological Survey in 2008 (open file 2008-8) with additional information published in 2016 (BCGS Paper 2016-1). The silica occurrences at the Sinter claims are described by The BC Geological Survey as follows: "A new occurrence characterized by stratified and strataform silica carbonate horizons, has been discovered within shallow-marine stratified volcanic and sedimentary rocks of the Late Triassic Nicola Group. Named the Castillian Creek Exhalite-Sinter, they have weakly anomalous signature for the epithermal suite of elements". The sinter consists of several stacked layers extending for approximately 500 meters along strike through a vertical elevation range of approximately 100 meters (strike north northeast, dip 20-30° southeast). The sinter is exposed along strike for approximately 300 meters. The exhalite and sinter exposures appear to be interbedded with Nicola Group volcanic rocks. No evidence has been found of any additional sampling of this occurrence since its discovery in 2008 and subsequent staking by Cariboo Rose in 2018.

In December 2021 and amended December 2022, the Company optioned the Coquigold property to CMP Mining Inc., which may earn a 70% interest in the project by making option payments totalling \$220,000 cash, issuing 200,000 common shares, and paying an additional \$280,000 in cash or shares, along with incurring \$2-million in exploration expenditures over a five-year term.

Fieldwork at Coquigold started in May, 2022 with 453 soil samples collected on new claims staked in January 2022. Several new areas with epithermal characteristics are interpreted in the data. This work was followed with a recently completed (December 2022) helicopter borne magnetic, radiometric and VLF-EM survey flown by Precision GeoSueys of Langley, BC (490 line kilometers flown). Diamond drilling was initiated Dec 2 with 3 completed. Core logging and sampling is still in progress.

Soil sampling completed in July, 2022 (453 samples), was followed in December 2022 by an airborne magnetic, very-low-frequency electromagnetic and radiometric survey (490 line kilometers) and a three-hole diamond drilling program in the D zone, where bedrock sampling by Cariboo Rose has confirmed an epithermal mineralizing system, with samples returning up to 43.1 grams per tonne silver, greater than 500 parts per million arsenic and greater than 100 parts per million antimony.

Three known occurrences on the property show indications of epithermal alteration; the Castillion Creek exhalative zone in the north containing three stacked exhalative/sinter units, the possible southern lateral extension of the Castillion Creek exhalative/sinter zone; the XYZ zone (six kilometers to the south) and an area of silica-altered plutonic and volcanic rock named the D zone (seven kilometers to the southeast), which was the focus of recent drilling; 274 meters in three holes (CQ22-01, 102.1 meters, CQ22-02, 145.4 m, and CQ22-03, 26.5 m).

Summary of drill results:

- CQ22-01: overburden 0 to 16 meters, hole bottom 112.1 m, no significant precious metal values;
- CQ22-02: overburden 0 to 19 m; strong limonite-carbonate alteration 71.0 to 95.0 m and 142.0 m to 145.4 m; hole bottom 145.4 m, no significant precious metal values;
- CQ22-03: overburden 0 to 3m; strong limonite-carbonate alteration 3.0 to 26.5 m; anomalous arsenic (to 90 parts per million) 4.0 to 16.0 m, hole bottom 26.5 m, no significant precious metal values.

Simultaneous to the drilling program an airborne survey (magnetic, radiometric and VLF-EM) was completed by Precision Geophysics of Langley, B.C. Of particular interest are linear features outlined by contrasting high and low magnetic intensity contours. An exploration permit application has been submitted to allow exploration of these features.

Lightning Strike Project, Clinton Mining Division, British Columbia

Gold mineralization in the area was first reported by Homestake Development Corporation in 1984 with the discovery of a significant soil gold anomaly underlain by Triassic aged shale and siltstone from which boulders grading up to 25.10 g/t gold were sampled (Homestake did not drill). Between 2006 and 2010 thirty-one drill holes were completed by a former claim owner. Six of these drill holes are located on the Lightning Strike claims and indicate mineralization is open to the south and east. Drill intercepts include 4.54 g/t gold over 3.8 meters, 19.30 g/t gold over 1.5 meters, 1.03 g/t gold over 26.0 meters and 0.77 g/t gold over 20.0 meters. In 2019 Cariboo Rose completed extensive soil and rock sampling to the east and south of historic work and confirmed mineralization is open for at least 1,300 meters to the south and 1,100 meters to the east of drill hole intercepts. Shale hosted gold deposits worldwide include the giant Murantau and Sukoy Log deposits in Russia with resources greater than 170 million and 20 million ounces gold respectively. A separate tungsten anomaly was also identified in 2019 with mineralized rubble returning assays up to 939 ppm W (0.12% WO₃).

In 2020, work focused on expanding the soil-survey coverage to the south and west of grids established in 2019. A total of approximately 2,000 samples were collected. Results indicated a gold anomaly extending approximately 1,500 metres in a north-south orientation and 1,000 metres in an east-west orientation. Anomalous gold values range from 12 parts per billion to 480 ppb and constitute approximately 12 per cent of the population. A larger soil-silver anomaly is coincident with the gold anomaly, except that it extends farther on the northwest side. Anomalous silver values range from two parts per million to 13.5 ppm with 70 samples exceeding three ppm. Coincident gold and silver are considered encouraging as they occur in a number of historic drill holes on the Lightning Strike property exemplified by diamond drill hole SC021 drilled by Spanish Mountain Gold Corp. in 2009. This hole returned a 5.0 m intercept grading 3.42 g/t gold and 228 g/t silver with mineralization hosted in black phyllite.

Significant drill holes from the 1,463-metre drill program completed in 2021 are shown in the table below.

LSRC21-06	7.2 g/t Ag and 0.62 g/t Au over 38.1m (91.4-129.5m)
	including
	16.3 g/t Ag and 1.43 g/t Au over 10.6m (108.2 – 118.9m)
LSRC21-07	6.8 g/t Ag and 0.34 g/t Au over 10.6m (126.5 – 137.2m)
LSRC21-08	14.8 g/t Ag and 0.54 g/t Au over 19.8m (64.0 – 83.8m)
	including
	34.2 g/t Ag and 1.0 g/t Au over 7.6m (74.7 – 82.3m)

Following a successful 2021 drill program where gold-silver mineralization was identified, the Company initiated an estimated 1,500 meter, 11-hole, reverse circulation drill program in September 2022.

The program consisted of 11 reverse circulation holes (1,466 metres) all collared in overburden. The permissive graphitic shale sequence, with variable concentrations of quartz and pyrite, was encountered in all holes, but only modest values in gold and silver were obtained.

A table of significant results from the current program are presented below.

Hole ID	From (m)	To (m)	Interval (m)	Gold
LSRC22-16	21.3	22.8	1.5	0.55
LSRC22-07	35.1	36.6	1.5	0.51
and	68.6	70.1	1.5	0.74
and	97.5	103.6	6.1	0.67
LSRC22-19	59.4	67.1	7.7	0.51
and	103.63	108.2	4.6	0.54
and	137.2	138.7	1.5	0.85
and	146.3	147.8	1.5	0.81

Topography at Lightning Strike is flat and outcrop is rare. The presence of high concentrations of graphite makes geophysical exploration techniques complex, and, consequently, exploration has been guided singularly by drilling, with most of the property remaining untested.

Quality Control

Information in this Annual MD&A is being prepared under the direction of J. William Morton, P. Geo., President and CEO, and Glen L. Garratt, P. Geo., Vice President and Qualified Persons as defined by National Instrument (NI) 43-101. They are responsible for the design and conduct of the exploration programs and the verification and quality assurance of analytical results.

RISKS AND UNCERTAINTIES

The Company has no history of profitable operations and its present business is at an early stage. As such, the Company is subject to many risks common to such enterprises, including under-capitalization, cash shortages and limitations with respect to personnel, financial and other resources and the lack of revenues. There is no assurance that the Company will be successful in achieving a return on shareholders' investment and the likelihood of success must be considered in light of its early stage of operations.

The Company has no source of operating cash flow and no assurance that additional funding will be available to it for further exploration and development of its projects when required. Although the Company has been successful in the past in obtaining financing through the sale of equity securities, there can be no assurance that the Company will be able to obtain adequate financing in the future or that the terms of such financing will be favourable. Failure to obtain such additional financing could result in the delay or indefinite postponement of further exploration and development of its properties.

Some of the Company's property interests are located in remote, undeveloped areas and the availability of infrastructure such as surface access, skilled labour, fuel and power at an economic cost, cannot be assured. These are integral requirements for exploration, development and production facilities on mineral properties. Power may need to be generated on site.

The mineral industry is intensely competitive in all its phases. Cariboo Rose competes with many other mineral exploration companies who have greater financial resources and technical capacity.

It is difficult at this stage to quantify the effect of increased demand for the goods and services used in the Company's exploration programs, but cost increases during the upcoming field season could be higher than the rate of inflation prevailing in other sectors of the economy. Exploration companies can also expect to experience difficulty in scheduling drilling contracts, airborne geophysical surveys and other services that are key components of early stage exploration programs.

Mineral exploration is a speculative venture. There is no certainty that the money spent on exploration and development will result in the discovery of an economic ore body. There is no assurance that the Company's exploration activities will result in any discoveries of commercial bodies of ore. The long-term profitability of the Company's operations will in part be related to the success of its exploration programs, which may be affected by a number of factors that are beyond the control of the Company. The market price of precious metals and other minerals is volatile and cannot be controlled.

The purchase of securities of the Company involves a high degree of risk and should be undertaken only by investors whose financial resources are sufficient to enable them to assume such risks. The Company's securities should not be purchased by persons who cannot afford the possibility of the loss of their entire investment. Furthermore, an investment in securities of the Company should not constitute a major portion of an investor's portfolio.

In recent years securities markets have experienced extremes in price and volume volatility. The market price of securities of many early stage companies, among others, have experienced fluctuations in price which may not necessarily be related to the operating performance, underlying asset values or prospects of such companies. It may be anticipated that any market for the Company's shares will be subject to market trends generally and the value of the Company's shares on the TSX Venture Exchange may be affected by such volatility.

The Company is very dependent upon the personal efforts and commitment of its existing management. To the extent that management's services would be unavailable for any reason, a disruption to the operations of the Company could result, and other persons would be required to manage and operate the Company.

Although the Company has exercised due diligence with respect to determining title to the properties in which it has a material interest, there is no guarantee that title to such properties will not be challenged or impugned. Third parties may have valid claims underlying portions of the Company's interests. Its claims, permits or tenures may be subject to prior unregistered agreements or transfers or native land claims. Title to the claims, permits or tenures comprising the Company's properties may also be affected by undetected defects. If a title defect exists, it is possible that the Company may lose all or part of its interest in the property to which such defect relates.

The Company's operations may be subject to environmental regulations promulgated by government agencies from time to time. Environmental legislation provides for restrictions and prohibitions on spills, releases or emissions of various substances produced in association with certain mining industry operations, such as seepage from tailings disposal areas that could result in environmental pollution. A breach of such legislation may result in the imposition of fines and penalties. In addition, certain types of operations require the submission and approval of environmental impact assessments. Environmental legislation is evolving in a manner that means standards are stricter, and enforcement, fines and penalties for non-compliance are more stringent.

The Company's directors and officers serve as directors or officers, or may be associated with other reporting companies or have significant shareholdings in other public companies. To the extent that such other companies may participate in business or asset acquisitions, dispositions, or ventures in which the Company may participate, the directors and officers of the Company may have a conflict of interest in negotiating and concluding terms respecting the transaction. If a conflict of interest arises, the Company will follow the provisions of the Business Corporations Act (British Columbia) dealing with conflicts of interest. These provisions state that where a director has such a conflict, that director must, at a meeting of the Company's directors, disclose his interest and refrain from voting on the matter unless otherwise permitted by the Business Corporations Act (British Columbia). The directors and officers of the Company are required to act honestly, in good faith and in the best interests of the Company.

FORWARD-LOOKING STATEMENTS

This MD&A contains forward-looking statements about the Company's future prospects, and the Company provides no assurance that actual results will meet management's expectations. All statements in this MD&A, other than statements of historical fact, that address exploration drilling, exploitation activities and events or developments that the Company expects to occur in the future, are forward looking statements. Forward looking statements are not guarantees of future performance and actual results may differ materially. Forward-looking statements included or incorporated by reference in this document include, without limitation, statements with respect to:

- The Company's assumptions and estimates used in its drill results, as well as the potential resource estimates and interpretations from those results;
- The progress, potential and uncertainties of the Company's drill programs;
- Expectations regarding the ability to raise capital and to continue its exploration and development plans on its properties; and

Forward-looking statements are necessarily based upon a number of estimates and assumptions that, while considered reasonable by the Company, are inherently subject to significant business, economic and competitive uncertainties and contingencies. Known and unknown factors could cause actual results to differ materially from those projected in the forward-looking statements. Such factors include, but are not limited to:

- fluctuations in the currency markets;
- fluctuations in the prices of minerals and other commodities;
- changes in government legislation, taxation, controls, regulations and political or economic developments in Canada or other countries in which the Company may carry on business in the future;
- risks associated with mining activities;
- the speculative nature of exploration, including the risk of obtaining necessary licenses and permits, and quantities or grades of reserves;
- the nature of mineral exploration and mining and the uncertain commercial viability of certain mineral deposits;
- the Company's lack of operating revenues; and
- the Company's ability to obtain necessary financing to fund the development of its mineral properties or the completion of further exploration programs.

This is not an exhaustive list of the factors that may affect the Company's forward-looking statements. Many of these uncertainties and contingencies can affect the Company's actual results and could cause actual results to differ materially from those expressed or implied in any forward-looking statements made by, or on behalf of, the Company. Readers are cautioned that forward-looking statements are not guarantees of future performance.

SUMMARY OF QUARTERLY RESULTS

The following table sets out selected unaudited quarterly financial information of Cariboo Rose and is derived from unaudited quarterly financial statements prepared by management. Cariboo Rose's interim financial statements are prepared in accordance with IFRS.

	Revenue	Net Loss (Income)	Loss (Income) per share
February 29, 2024	\$ Nil	\$ 133,311	\$ 0.00
November 30, 2023	Nil	59,338	0.01
August 31, 2023	Nil	68,602	0.01
May 31, 2023	Nil	39,942	0.00
February 28, 2023	Nil	207,646	0.00
November 30, 2022	Nil	24,017	0.00
August 31, 2022	Nil	35,424	0.00
May 31, 2022	Nil	30,167	0.00

Quarterly results will vary in accordance with the Company's exploration and financing activities.

Mineral exploration is typically a seasonal business, and accordingly, the Company's administrative expenses and cash requirements will fluctuate depending upon the season. The Company's primary source of funding is through the issuance of share capital. When the capital markets are depressed, the Company's activity level normally declines accordingly. As capital markets strengthen and the Company is able to secure equity financing with favourable terms subsequent activity levels will increase.

Another factor that affects the Company's reported quarterly results are write-downs of capitalized mineral property interests. At the end of each reporting period, the Company reviews the carrying amounts of its mineral property costs to determine whether those assets have suffered an impairment. The size and timing of these impairments cannot typically be predicted.

LIQUIDITY

The Company had working capital of \$32,039 on February 28, 2024 (2023 - \$447,545).

CAPITAL RESOURCES

The Company has no operations that generate cash flow and its long-term financial success is dependent on management's ability to discover and develop economically viable mineral deposits. The mineral exploration process can take many years and is subject to factors that are beyond the Company's control.

In order to finance the Company's exploration and development programs and to cover administrative and overhead expenses, the Company raises money through equity sales and from the exercise of convertible securities. Although the Company has been successful in the past in obtaining financing, there can be no assurance that it will be able to obtain adequate financing in the future or that the terms of such financing will be favourable. Many factors influence the Company's ability to raise funds, including the health of the resource market, the climate for mineral exploration investment, the company's track record and the experience and calibre of its management.

TRANSACTIONS WITH RELATED PARTIES

The key management personnel of the Company are the directors, Chief Executive Officer and Chief Financial Officer.

In the normal course of business, the Company will enter into transactions with a related company, Eastfield Resources Ltd. ("Eastfield"), for the use of equipment, services and rental of office space. The Company is related to Eastfield through common key management personnel. During the year ended February 29, 2024, amounts payable for rent, salaries, telephone, office, consulting, convention, and travel costs to Eastfield amounted to \$113,374 (2023 - \$108,291). At February 29, 2024, payable to related parties included \$1,837 (2023 - \$13,625) payable to Eastfield. At February 29, 2024, total due from related parties of \$35,596 (2023 - \$12,000) was due from Eastfield.

During the year ended February 29, 2024, geological services totaling \$99,488 (2023 - \$139,611) were provided to the Company by Mincord Exploration Consultants Ltd. ("Mincord"), a geological service company owned by two directors of the Company. Mincord's relationship with the Company is non-exclusive and without retainer, and Mincord is used on a project-by-project basis. Services provided include the hiring of field and professional personnel, rental of vehicular, camp and technical equipment, and transportation and mobilization costs. The amounts for geological and exploration services also include payments for services on properties managed by the Company on behalf of joint venturers. At February 29, 2024, payable to related parties included \$9,449 (2023 - \$5,355) payable to Mincord.

Remuneration in the form of share-based compensation for key management personnel for the year ended February 29, 2024 was \$25,924 (2023 - \$nil).

FINANCIAL AND OTHER INSTRUMENTS

At present, the Company's most significant financial instruments are cash, accounts receivable, project deposits, investments in marketable securities and accounts payable and accrued liabilities. The recorded amount of these financial instruments approximate their fair value. The Company does not consider its financial instruments exposed to significant liquidity, credit, or price risks as at February 28, 2023.

Marketable Securities/ Investments

As at February 29, 2024 the Company has the following investments.

	2024			2023		
	Number of Shares	Cost	Fair Value	Number of Shares	Cost	Fair Value
Vizsla Copper Corp.	173,834	\$ 84,478	\$ 13,907	174,729	\$ 84,478	\$ 39,314
Basin Uranium	25,000	10,000	6,000	25,000	10,000	10,000
CMP Mining	100,000	6,000	7,625	100,000	6,000	12,000
		\$ 100,478	\$ 27,532		\$ 100,478	\$ 61,314

ADDITIONAL DISCLOSURE FOR VENTURE ISSUERS WITHOUT SIGNIFICANT REVENUE

Additional disclosure concerning Cariboo Rose's general and administrative expenses are provided in the Company's Financial Statements for the years ended February 29, 2024 and February 28, 2023 that is available on Company's website at www.cariboorose.com or on its SEDAR Page Site accessed through www.sedar.com.

Outstanding Share Data

The Company is authorized to issue an unlimited number of common shares without nominal or par value. As at June 28, 2024 there were 47,461,888 common shares issued and outstanding.

Share Purchase Options

The following common share purchase options are outstanding at June 28, 2024:

Expiry Date	Options Outstanding and Exercisable		Weighted Average Remaining Life (Years)
	Number of Share Options	Exercise price	
December 19, 2024	650,000	\$ 0.05	0.48
August 29, 2026	500,000	0.11	2.17
September 15, 2026	770,000	0.06	2.22
February 23, 2027	1,550,000	0.06	2.66
October 10, 2027	500,000	0.11	3.29
June 7, 2028	200,000	0.05	3.94
December 14, 2028	550,000	0.05	4.47
	4,720,000	0.07	2.57

Dividends, Off Balance Sheet Arrangements or Proposed Transactions

As of June 28, 2024, the Company has no off-balance sheet arrangements or proposed transactions which require disclosure. The Company has no earnings or dividend record and is unlikely to pay any dividends in the foreseeable future.

APPROVAL

The Board of Directors of Cariboo Rose has approved the disclosure contained in this Annual MD&A. A copy of this Annual MD&A will be provided to anyone who requests it.

ADDITIONAL INFORMATION

Additional information relating to the Company including the Company's financial statements may be found under the Company's profile on SEDAR at www.sedar.com or by visiting the Company's website at www.cariboorose.com.
